This arrangement constitutes a condenser, or capacity, so that if a charge of any given nature be communicated to the tinfoils of one set, a charge of opposite nature is acquired by the tinfoils of the opposite set, and this charge cannot be dissipated except through some path left open between the two connections. We give (Fig. 28) an illustration of a finished condenser of this type. 40. Position of Condenser. --Whatever be the system adopted for setting up the high tension current in the secondary winding, whether it be an-independent coil or whether it take the form of coils of fine wire insulated from, but superimposed on, the primary, the position of this condenser...
